SR. CUSTOMER TECHNICAL ARCHITECT

Dennis Katumalla

Hands-on AIOps and Observability architect. 16 years making enterprise monitoring deliver measurable outcomes for Fortune 500 customers.

M.S. Computer Science, University of Iowa · PMP · AWS AIOps Professional · AI Governance and Strategy (Wharton)

$40M+
Annual technical wins as lead architect (account-team ELA revenue)

35%
Lower MTTR with AI-driven event correlation

88%
Less alarm noise with GenAI incident automation

CUSTOMER EXPERIENCE · THE CHALLENGE

Replace the incumbent APM platform at a Fortune 500 utility, without risking storm season

The goal

Consolidate Dynatrace and SolarWinds onto one platform: lower cost, coverage across network, infrastructure and legacy systems, and reliable outage reporting for millions of customers. My foothold: they already relied on our DX NetOps, especially for SD-WAN monitoring.

My role

Technical lead from evaluation through implementation: PoC with written success criteria, target architecture, migration plan, and enabling the six-person monitoring team (U.S. and India), plus a weekly Friday enablement session open to the whole company. I took each design through the Architecture Review Board.

The risks

- **Technical:** 5,000+ agents across apps, infrastructure and network
- **Political:** the TIBCO team relied on Dynatrace's live view of every JVM thread
- **Timing:** hurricane-season change freezes

CUSTOMER EXPERIENCE · HOW I DELIVERED

Phase it, run in parallel, prove it first

Investigate and unblock

The TIBCO thread view was missing. I automated thread dumps (kill -3, jcmd Thread.print) into the same running, blocked and waiting view, bought time until the product shipped it two releases later, and made the TIBCO team our design partner and beta tester.

Balance scope, time and quality

A 2-month PoC (typically 1 week), run as one PoC per team, each judged against its own tool: Dynatrace for TIBCO and Java, SolarWinds for sysadmins and DBAs. Then waves and cut-overs around change freezes, with the old tools in parallel until the last wave. Nothing left behind.

Restore and adjust

In production, the Java agent on its High profile (set for maximum visibility) slowed the apps, and the JVM team pulled it. I benchmarked, restarted on Low, then moved to the recommended Medium once the team trusted it.

Alongside the day job

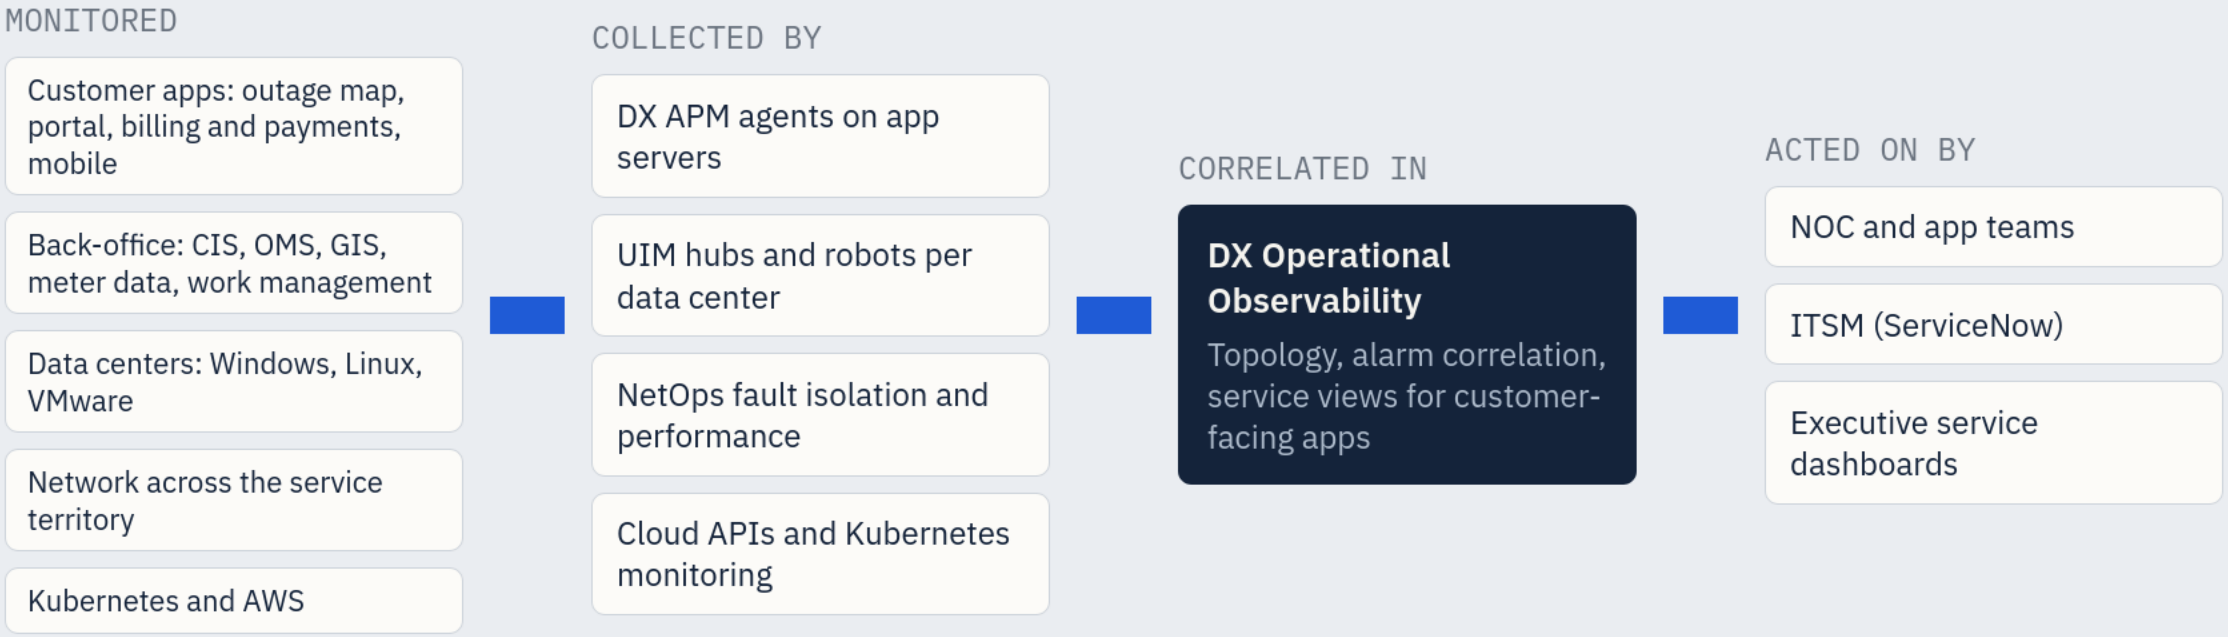

Technical owner for 14 other accounts at the same time. I shared the rollout with the customer's monitoring and platform teams, and our 8 consultants covered for each other as needed.

BUSINESS VALUE

5,000+ agents migrated in 2 years · 3 tools retired (Dynatrace, SolarWinds, Hyperping) · 40% lower observability tooling cost, in one ELA · from monitoring to service observability and SLOs

TECHNICAL EXPERIENCE · TARGET ARCHITECTURE

One platform for every layer

IN LOGICMONITOR TERMS

Hubs and robots → **Collectors** with auto-balanced groups

Probes and templates → **LogicModules** and AppliesTo

Fault isolation → **topology** and alert dependencies

Alarm correlation → **Edwin AI** insights

One environment, two audiences

EXECUTIVE VIEW · OUTCOMES AND RISK

Can customers report outages, and how long are they waiting?

- Customer journey available from 5 locations worldwide
- Customers without power and open outages
- Customers waiting for an estimate: the storm risk
- Active alerts by severity

Live dashboard: Outage Reporter · Executive

ENGINEER VIEW · OPERATIONS

What is broken, where, and who has the ticket?

- Latency, error rate and data-store health
- JVM heap and GC, CPU, memory, disk
- App logs on the same resource as the metrics
- Alerts routed to on-call, one per cause

Live dashboard: Outage Reporter · Engineer

BUILT FROM A BLANK AWS ACCOUNT Deployed from code · Collector and read-only AWS role · SNMP, JMX and a Groovy DataSource · web check from 5 locations · LM Logs · alert routing

WHY I'M A STRONG HIRE

I've done every part of this role

Customer outcomes

Adoption, renewal and expansion: $40M+ annual technical wins

Observability depth

I know the estates LogicMonitor replaces: 35% lower MTTR

Agentic AI builder

Ready to make Edwin AI real: 88% less alarm noise

THE ROLE, AS POSTED · WHERE I'VE DONE IT

Responsibility	Proof
Customer engagement	Primary technical contact, Fortune 500
Technical strategy	Business targets agreed before design
Solution design	VMware, Windows, Linux, SQL, K8s, AWS
Technical advisory	Migrations off UIM, DX and Dynatrace
POCs	PoC-led wins with written success criteria
Troubleshooting	APM, infrastructure and network RCA
Training	Workshops; global developer program
Feedback to product	Field input to Scout AI strategy
Presentations, demos	This deck, and the live demo next

30-60-90 DAYS

Learn, then contribute, then lead

DAYS 1–30

Learn

- LogicMonitor certifications and Edwin AI training
- Shadow senior CTAs on customer calls
- Meet every assigned account; baseline health and KPIs
- Learn the field playbooks and the PDE roadmap

Measured by: every account baselined

DAYS 31–60

Contribute

- Own day-to-day technical relationships
- Agree a success plan with KPIs per account
- Quick wins: critical services covered, noise tuned
- Run a first best-practices workshop

Measured by: success plans signed off

DAYS 61–90

Lead

- Value reviews with customer leadership
- POCs of new features, starting with Edwin AI
- Customer needs into the PDE roadmap
- Share a DX/UIM migration playbook

Measured by: KPI movement and expansion pipeline
